MANUFACTURER,

W. R. CROOK,

35 VALLEY ROAD, MT. EDEN

Phone 63-539

-- DIRECTIONS --

HOW TO TREAT DIFFERENT WEEDS

THISTLES, ETC.

Canadian, Californian, Scotch Thistles, Hemlock, Ragwort, and Fennell. If in the young or rosette stage just spray the centre or heart. If going to seed (A) spray stem near the ground; (B) cut off near ground and spray stalks.

BLACKBERRY & GORSE

Blackberry it is best to cut or burn off first, leave to sprout and then spray the crown where new growth appears. Gorse can be treated without cutting down by damaging stem near the ground and applying spray to damaged stump, but the most effective way is to cut it down, and then spray stump near the ground, or burn it off; leave to sprout, and then spray where

new growth appears. It takes two to three months to kill these weeds.

RUSHES

Just spray the clump as near the ground as possible after cutting off.

DOCKS, DAISIES, ETC.

A few drops in centre or heart of each plant will eat roots away.

NUT GRASS OR TWITCH

Spray in Autumn. They may need several applications if showing new growth. This preparation continues to act on roots for six months after application. Do not waste it by spraying foliage. Do not dilute

DO NOT DILUTE

NOTICE TO FARMERS

Clear your farm of Noxious Weeds and increase your Cream and Wool cheques by using **CROOK'S NOXIOUS WEED EXTERMINATOR**. It has been proved that the old method of spraying the foliage of any Noxious Weeds is obsolete as the source of nearly all growth is the root; therefore once that is destroyed, life ceases to exist. If foliage is sprayed, the tops die and dry up and the stem or crown throw out a more vigorous growth. Therefore if you use **CROOK'S NOXIOUS WEED EXTERMINATOR**, and carry out the instructions on this pamphlet you will rid your farm of all weed pests.

It works out cheap if you use
as instructed.
